

Considering the tests conducted, the runtime implemented works exactly the same as the one from the provided image. It was so similar that no changes were made to the handler and it worked normally.

One thing that may cause problems, however, is date formatting. There are two attributes of the Context object which are dates and, without some more details on how it was formatted in the original image, the proposed implementation may be incompatible. Here, the default formatting from the datetime library was used. But then again, these attributes were not used in the proposed handler function, so no issue arose. This may not hold if some handler function depends on how the dates are formatted in the Context object.
